If the owner was infected and recovered >14 days before contact with the clinic, and if there is no further transmission in the household, the patient may be considered low risk.

* Within the past 2 weeks

†† All personnel involved in patient handling or procedures should wear gown and gloves, at a minimum. Personnel not involved in a procedure should be kept out of the room. Mask and eye protection or face shield should be worn if there will be close contact during restraint and procedures. For work that will potentially involve contact with aerosols (e.g., working around a dog’s face, intubation), an N95 mask should be used in place of a surgical mask. If an N95 mask is not available, surgical mask and face shield is likely an acceptable alternative if care is taken to ensure that the user faces the patient at all times during aerosol generation (to avoid exposure through the sides).
